Abstract of DE 10256164 (A1)

A catalyst system for the hydroformylation of ethylenic compounds in homogeneous anhydrous media comprises a Sub-Group VIII metal complex with a water-insoluble polymeric ligand consisting of a polymer with at least 10 nitrogen atoms and at least 3 attached phosphorus-containing groups. A method for the hydroformylation of compounds with ethylenic double bond(s) by reaction with carbon monoxide and hydrogen in a homogeneous anhydrous phase in presence of a catalyst system containing Sub-Group VIII metal(s) and essentially water-insoluble polymeric ligand(s) consisting of a polymer structure with at least 10 nitrogen atoms and at least 3 attached phosphorus-containing groups. An Independent claim is also included for catalysts as described above.
